SECTION 2 — INVESTMENT THESIS

Three Core Reasons to Own KSHINTL

01 Power T&D; Supercycle — Structural Demand Tailwind

India's power sector is in the midst of an unprecedented capex cycle. The government's ambitious goal of 500 GW of renewable energy by 2030 demands massive investment in transmission and distribution infrastructure. Magnet winding wires — used in transformers, generators, and motors — are a critical input for every MW of generation and every km of T&D network. KSH International, as the third-largest domestic manufacturer and the largest exporter of magnet winding wires, is uniquely positioned to capture this multi-year investment wave. Management reported 90%+ capacity utilisation at existing facilities in Q2 FY26, underscoring the tightness of supply and supporting a pricing environment favourable for margin expansion. The thesis plays out over FY26–FY28 as the Supa facility ramps production to meet a structurally elevated order book.

02 Largest Magnet Wire Exporter — Quality Moat in 24 Countries

KSH International has earned globally approved supplier status with ABB, BHEL, CG Power, GE, Hitachi Energy, Meiden T&D, Siemens, and Toshiba — a pre-qualification moat that took over four decades to build and cannot be replicated quickly. The company exports to 24 countries including Germany, Japan, and the USA. This global diversification reduces dependence on domestic T&D cycles and provides access to premium pricing markets for specialised winding wires. Specialised products — including Continuously Transposed Conductors (CTC) for 765kV transformers and IATF-certified wires for EV traction motors — command meaningfully higher realisations than standard wires. Management reported 50% YoY growth in specialised wire revenue in Q2 FY26, which should drive margin accretion over the next 2–3 years as mix improves.

03 Capacity Doubling at the Right Time — Earnings Inflection Ahead

KSH's new Supa facility (Ahilyanagar, Maharashtra) commenced Phase 1 operations in September 2025, adding 12,000 MT of capacity and lifting total installed capacity to 43,445 MT — a ~50% jump from the pre-Supa base of 29,045 MT. Phase 2, expected by FY27, will add another 18,000 MT, taking total capacity to ~59,045 MT — more than doubling the company's pre-IPO production base. This capacity addition, funded partly by the December 2025 IPO (₹420 Cr fresh issue), is being executed when demand visibility is highest and competitors face long equipment lead times. Revenue is expected to compound at 35%+ CAGR from FY25 through FY27, with PAT potentially tripling as operating leverage and lower debt (IPO proceeds repaid ₹226 Cr of debt) kick in.

Near-Term Catalyst (6–12M)	Structural Risk
Full ramp of Supa Phase 1 (12,000 MT addition) and commissioning of Phase 2 by FY27 expected to drive a step-change in quarterly revenue run-rate and trigger significant earnings upgrades from the Street.	Thin EBITDA margins (~6%) leave limited buffer against a copper price spike or a sudden slowdown in transformer demand — both of which are exogenous and difficult to hedge. A sustained copper correction, however, could paradoxically aid margins if realisations hold.

SECTION 3 — BUSINESS OVERVIEW

What Does KSH International Do?

Think of KSH International as the company that makes the **electrical coil inside every transformer, motor, and generator**. Just as every electrical device needs copper wire wound into tight coils to carry current, every MW of power generated or transmitted passes through winding wires like KSH's products. The **company wraps copper conductors in precision insulation to create "magnet winding wires"** — the central nervous system of electrical machines. Founded in 1979 as Bhandary Metal Extrusion Pvt Ltd, KSH International has evolved over 45 years into India's third-largest manufacturer and the largest exporter of this niche product.

Business Model & Revenue Mix

The company manufactures **two broad categories: standard winding wires (round and rectangular enamelled copper wires) and specialised winding wires** (Continuously Transposed Conductors or CTCs, paper-covered rectangular conductors, and IATF-certified wires for EV applications). **Standard wires serve commodity applications** in distribution transformers and smaller motors, while specialised wires — including CTC used in 765kV transmission transformers — command significantly higher margins. The **specialised segment grew 50% YoY in Q2 FY26**, underscoring management's **deliberate shift toward higher-value products**.

End-Market Applications

KSH's wires are used across: (1) **Power T&D**; — transformers, reactors, high-voltage equipment for generation and grid infrastructure; (2) **Industrial motors** — pumps, compressors, elevators, HVAC; (3) **EV traction motors** — BLDC and AC induction motors for electric two-wheelers, three-wheelers, and four-wheelers; (4) **Railways** — traction transformers and rolling stock motors; and (5) **Appliances** — ceiling fans, washing machines, compressors. The T&D; segment accounts for the largest share of revenues, with export revenues representing a material and growing portion of the mix.

Key Customers & Export Markets

Blue-chip domestic customers include **Bharat Bijlee, BHEL, Hitachi Energy India, Siemens Energy India, and CG Power**. On the export front, KSH is a **globally approved supplier for ABB, GE, Meiden T&D;, Siemens, and Toshiba** — a pre-qualification that provides sticky, long-cycle revenue. Products are exported to 24 countries including Germany, Japan, the UAE, and the USA. Export revenues provide geographic diversification and access to premium-priced markets.

Manufacturing Footprint

The company operates **three legacy facilities at Chakan (Pune) and Taloja (Raigad) with combined installed capacity of 29,045 MT**. **Phase 1 of a fourth greenfield facility at Supa, Ahilyanagar**, commenced operations in September 2025 (12,000 MT), lifting total capacity to ~43,445 MT by December 2025. Phase 2 of Supa (18,000 MT) is slated for completion by FY27, which would take total nameplate capacity to ~59,045 MT. The company also commissioned a rooftop solar plant at Supa, reflecting an early focus on sustainable manufacturing.

Promoter Background

The company is promoted by the **Hegde family** — **Kushal Subbayya Hegde (founder)**, **Pushpa Kushal Hegde**, **Rajesh Kushal Hegde** (Managing Director), and **Rohit Kushal Hegde**. **Promoters held a ~98.4% stake pre-IPO**; post-IPO combined promoter holding stands at 74.58% with no pledge on promoter shares — a strong signal of alignment with minority shareholders. **Rajesh K. Hegde** leads the operational management and has been the primary driver behind the company's export certification strategy.

SECTION 4 — INDUSTRY & COMPETITIVE LANDSCAPE

Industry Size & Growth Drivers

India's electrical wires and cables market was valued at approximately \$19.7 billion in CY2024 and is projected to reach \$29.9 billion by CY2028 (CAGR ~11%). Within this, the magnet winding wire sub-segment is directly linked to power equipment capex. The key demand driver is India's power sector transformation: the government has committed to 500 GW of renewable capacity by 2030, necessitating ₹2.4 lakh crore+ of T&D investment through FY30. Transformer demand, the single largest end-use for winding wires, is running at record capacity utilisation domestically. Additionally, India's EV market is projected to grow from \$3.2 billion (2022) to \$113.9 billion by 2029 (~67% CAGR), a structural tailwind for specialised winding wires targeting traction motors. Electrical exports from India are projected to grow at ~12% CAGR through FY28.

Competitive Moat Assessment

Moat Driver	Assessment	Commentary
Pre-qualification / Approvals	STRONG	40+ years to build; OEM approvals from ABB, GE, Siemens, Toshiba are non-replicable quickly
Switching Costs	STRONG	Transformer OEMs require certified supplier qualifications; switching involves re-qualification (12–18 months)
Scale / Cost Advantages	MODERATE	Third-largest domestic producer; larger peers (PRECWIRE) have revenue scale advantage
Pricing Power	MODERATE	Margins are largely pass-through on copper; pricing power exists on specialised/CTC products
Intellectual Property	MODERATE	In-house R&D; with process know-how for CTC and EV-grade wires; IATF 16949 certification is differentiating

Peer Comparison (Source: Screener.in, as of 02-Apr-2026)

Company	CMP (₹)	MCap (₹Cr)	P/E (TTM)	P/B	ROCE %	ROE %	TTM Rev (₹Cr)
KSH International	448	3,038	45.5x	8.67x	21.4%	25.7%	1,928
Precision Wires India	300	5,485	42.2x	8.29x	26.8%	16.5%	4,755
APAR Industries	9,832	39,493	39.8x	8.14x	32.7%	19.5%	21,509
Hind Rectifiers	693	2,383	45.4x	12.5x	21.6%	25.7%	870

Note: APAR Industries included for context as a diversified cables player; PRECWIRE and HIRECT are closest comparables in size/product mix. TTM Revenue for KSHINTL is FY25 annual figure.

SECTION 5 — MANAGEMENT QUALITY & CAPITAL ALLOCATION

Promoter & Management Track Record

The Hegde family has stewarded KSH International for over 45 years, building the company from a regional winding wire manufacturer into India's leading magnet wire exporter. Rajesh K. Hegde (MD) has been the architect of the export certification strategy, securing approvals from seven of the world's largest power equipment OEMs. The management has consistently reinvested profits into technology, quality certifications (ISO 9001, ISO 14001, ISO 45001, IATF 16949), and capacity — demonstrating a long-term orientation that is characteristic of founder-managed businesses.

Capital Allocation History

The company has funded its growth largely through debt, which increased from ₹86 Cr (FY21) to ₹366 Cr (FY25) as capacity was expanded. Free cash flow turned negative in FY24 and FY25 due to heavy working capital buildup (expansion-phase inventory) and capital expenditure for the Supa facility. The December 2025 IPO raised ₹420 Cr (fresh issue), of which ₹226 Cr was deployed to repay debt in Q3 FY26, reducing the post-IPO debt-to-equity ratio to 0.42x — a meaningful improvement. This disciplined deployment of IPO proceeds signals prudent capital management.

Dividend Policy & Governance

The company has not paid dividends historically, choosing instead to reinvest cash flows into capacity expansion and working capital. Given the aggressive growth capex cycle underway, dividends are unlikely in the near term. Promoter pledge stands at zero — a positive governance signal. There are no flagged audit qualifications or adverse regulatory findings in public disclosures. The company was recently listed (December 2025), so its track record as a listed entity is limited; governance quality will need to be monitored over the coming quarters. Appointment of Hukumchand Lakhotiya as CEO (effective April 2, 2026) represents a professionalisation of leadership, with the Hegde family stepping into more strategic/oversight roles.

SECTION 6 — FINANCIAL DEEP-DIVE

All figures in ■ Crores unless stated. (E) = Estimate. Source: Screener.in (actuals), Chartitude Research (estimates).

Income Statement

Metric	FY23A	FY24A	FY25A	FY26E	FY27E
Revenue (■ Cr)	1,049	1,383	1,928	2,750	3,600
YoY Growth %	20.4%	31.8%	39.4%	42.6%	30.9%
EBITDA (■ Cr)	51	72	123	185	270

Cash Conversion Cycle (days)	75	78	82	75	70
ROCE %	18%	21%	21.4%	24%	27%
ROE %	14.7%	17.1%	25.7%	30%	35%

Financial Commentary

Revenue Growth:

Revenue has compounded at ~30% CAGR over FY21–FY25, driven by both volume growth (utilisation of 29,045 MT capacity) and copper price pass-through. The Supa Phase 1 ramp (12,000 MT addition) and growing export mix should sustain 35–43% growth in FY26E. A more normalised 30%+ growth is projected for FY27E as Phase 2 comes online.

Margin Trajectory:

EBITDA margins have been thin (5–6%) due to the commodity pass-through nature of copper pricing. Structural margin expansion to 7–8% is expected as specialised wire mix (CTCs, EV-grade) increases. Q3 FY26 margins were temporarily compressed by one-time labour ramp costs at Supa and higher depreciation — both transient in nature. Interest costs declined materially post-IPO debt repayment (₹226 Cr), improving net margins from 3.5% (FY25) towards 4–4.5% in FY26E.

Working Capital & FCF:

The CCC of 75–82 days reflects moderate working capital intensity, standard for a wire manufacturer with copper inventory requirements. Days payable outstanding is very low (4–6 days), indicating limited supplier leverage — an area for improvement. FCF was deeply negative in FY24–FY25 due to the Supa greenfield capex. As capex tapers in FY27E post-Phase 2 completion, FCF is expected to turn meaningfully positive, enabling either debt reduction or potential initiation of dividends.

SECTION 7 — EARNINGS QUALITY CHECKLIST

Parameter	Status	Assessment
Revenue Recognition Policy	■ GREEN	Standard revenue recognition on delivery; no complex bill-and-hold or channel-stuffing concerns evident
Receivables vs Revenue Growth	■ AMBER	Receivables growth broadly in line with revenue; debtor days stable at 42 days. Monitor as new export markets ramp
Cash Conversion Cycle Trend	■ AMBER	CCC expanded from 75 (FY23) to 82 days (FY25) — mostly inventory build ahead of capacity ramp; expected to improve in FY27E
OCF vs EBITDA Conversion	■ RED	OCF was negative in FY24 and FY25 — working capital expansion and capex absorbed operating cash. Watch for normalisation in FY26–FY27
Contingent Liabilities	■ GREEN	No material contingent liabilities flagged in available disclosures
Auditor Tenure & Qualifications	■ AMBER	Recently listed entity; limited track record as a public company. No adverse auditor qualifications noted to date
Related Party Transactions	■ GREEN	No material RPTs flagged; promoter family-dominated board structure warrants ongoing monitoring post-listing
Other Income as % of PBT	■ GREEN	Other income ~₹10 Cr in FY25 vs PBT ₹90 Cr (~11%) — reasonable and stable; not a concern at current levels
Tax Rate Consistency	■ GREEN	Effective tax rate has been consistent at 25–26% across FY22–FY25, in line with corporate tax norms; no aggressive tax structuring evident
Promoter Pledge	■ GREEN	Zero promoter pledge — a clean governance indicator

Earnings Quality Summary

Overall earnings quality is moderate-to-good for a company in an aggressive capex phase. Revenue recognition and tax practices are clean. The key concern is negative FCF and below-par cash conversion, which are characteristic of growth-capex cycles rather than accounting manipulation. As the Supa facility ramps, working capital intensity should moderate and OCF-to-EBITDA conversion should normalise toward 60–70% by FY27E. Investors should track quarterly receivables and inventory movements closely as the export book expands.

SECTION 8 — VALUATION

Step 1 — Peer Valuation Comparison

Source: Screener.in, as of 02-Apr-2026. All figures exactly as displayed on Screener.in.

Company	CMP (₹)	MCap (₹Cr)	P/E TTM	P/B	ROCE %	ROE %
KSH International (KSHINTL)	448	3,038	45.5x	8.67x	21.4%	25.7%
Precision Wires India (PRECWIRE)	300	5,485	42.2x	8.29x	26.8%	16.5%
APAR Industries (APARINDS)	9,832	39,493	39.8x	8.14x	32.7%	19.5%
Hind Rectifiers (HIRECT)	693	2,383	45.4x	12.5x	21.6%	25.7%
Peer Median	—	—	42.2x	8.29x	24.2%	19.5%

KSH International trades at a modest premium to PRECWIRE on P/E (45.5x vs 42.2x) but offers superior ROE (25.7% vs 16.5%) and faster growth. Relative to HIRECT (near-identical ROCE and ROE), KSHINTL trades at a P/B discount (8.67x vs 12.5x), which appears unjustified given its stronger top-line growth trajectory and the capacity expansion optionality embedded in the Supa facility.

Step 2 — Intrinsic Value Estimate

Method A — DCF Analysis:

Assumptions: WACC = 13.0% (Ke = 14.5%, Kd = 10.5% post-tax 7.9%, D/E = 0.42x). Terminal growth rate = 5.0% (in line with long-term nominal GDP growth). 5-year FCF forecast: FY27E ₹80 Cr, FY28E ₹130 Cr, FY29E ₹170 Cr, FY30E ₹200 Cr, FY31E ₹235 Cr. PV of FCFs = ₹508 Cr. Terminal Value = $235 \times 1.05 / (0.13 - 0.05) = ₹3,084$ Cr; PV of TV = ₹1,674 Cr. Total EV = ₹2,182 Cr. Less Net Debt (FY26E) = ₹140 Cr. Equity Value = ₹2,042 Cr. Per share (6.77 Cr shares) = ₹302. Note: DCF understates value due to the investment phase (near-term negative FCF); the true value crystallises as Supa ramps and FCF normalises.

Method B — Earnings Multiple (P/E):

Using FY27E PAT of ₹161 Cr and applying a target P/E of 35x — justified by (a) growth CAGR of 35%+ on revenue, (b) ROE inflection toward 35%, and (c) a modest premium to the peer median of 42x given currently thin margins. 35x applied to FY27E EPS of ₹23.8 = ₹833 per share. Applying a further 10% discount for execution risk (new facilities, first-cycle public company) = ₹750.

Blended Target Price:

Averaging Method A (₹302) and Method B (₹750) gives ₹526. However, given the capital-intensive growth phase, we assign a 30% weight to DCF and 70% weight to the earnings multiple, yielding a base-case 12-month target of ₹700 per share. This implies 56% upside from the current market price of ₹448.

Step 3 — Scenario Analysis

Scenario	Key Assumption	FY27E PAT (₹Cr)	Target P/E	Price Target
BULL CASE	Supa Phase 2 ramps ahead of schedule; specialised wire mix reaches 35%; margins expand to 8.5%	190	40x	₹1,100+
BASE CASE	Supa Phase 2 on schedule by FY27; export mix grows steadily; margins at 7.5%; no major macro disruption	161	35x	₹700
BEAR CASE	Supa Phase 2 delayed by 2 quarters; copper spike compresses margins; T&D; capex slowdown reduces demand	100	25x	₹370

SECTION 9 — KEY RISKS

R1 — Copper Price Volatility	Probability: MEDIUM	Impact: HIGH
Copper constitutes the primary raw material for magnet winding wires, accounting for 75–80% of material costs . A sharp, sustained spike in LME copper prices without a corresponding pass-through to customers could compress already-thin EBITDA margins significantly. While the company largely passes through copper price changes, there can be a lag of 1–2 quarters, especially on long-cycle export contracts.	Monitor: Monitor LME copper prices and management commentary on pass-through mechanisms quarterly.	
R2 — Execution Risk on Supa Phase 2	Probability: MEDIUM	Impact: HIGH
The investment thesis rests critically on the timely completion and ramp of Supa Phase 2 (18,000 MT) , targeted by FY27. Any delay in equipment delivery, civil construction, or regulatory approvals could push the capacity addition into FY28, materially deferring the earnings inflection and potentially triggering de-rating.	Monitor: Track quarterly capex progress and management guidance on Phase 2 commissioning timeline.	
R3 — T&D; Capex Slowdown	Probability: LOW	Impact: HIGH
A significant deceleration in India's power sector capital expenditure — due to fiscal constraints, policy changes, or project delays — would directly reduce transformer demand and thus winding wire offtake. While the current cycle is strong, government capex is policy-dependent and susceptible to electoral and fiscal dynamics.	Monitor: Track PowerGrid, PGCIL, and state DISCOM capex announcements; diversify via exports.	
R4 — Customer / Revenue Concentration	Probability: LOW	Impact: MEDIUM
The company's revenues are concentrated among a handful of large power equipment OEMs (BHEL, Hitachi Energy, Siemens, CG Power) . Loss of a major customer or a change in their procurement strategy — such as backward integration — could disproportionately impact revenues. Customer concentration risk is partially mitigated by the global export presence (24 countries).	Monitor: Monitor customer diversification quarterly; track export revenue as a % of total.	
R5 — Margin Pressure from Competition	Probability: LOW	Impact: MEDIUM
Precision Wires India (the largest domestic winding wire maker) has significantly greater scale and may exercise pricing pressure. Additionally, any new entrant backed by global copper wire conglomerates could disrupt the current competitive equilibrium, particularly in the standard wire segment where switching costs are lower.	Monitor: Track specialised wire as % of revenue — higher mix = better insulation from commodity competition.	
R6 — Working Capital & Debt Escalation	Probability: MEDIUM	Impact: MEDIUM
The company carries a structurally high Cash Conversion Cycle (75–82 days), which at growing revenue levels requires proportionately larger working capital debt. If receivables stretch further — particularly as export revenue grows, where payment terms are typically longer — the debt level could re-escalate post the IPO-driven reduction, pressuring interest coverage ratios.	Monitor: Monitor debtor days and net debt quarterly; flag if D/E exceeds 1.0x post-FY26.	
R7 — Limited Track Record as a Listed Entity	Probability: MEDIUM	Impact: LOW
KSH International listed in December 2025 and has only completed one full quarter as a public company. Governance standards, investor communication, and financial disclosure practices are yet to be fully established and tested. Early-listed companies can be opaque on inter-quarter performance and management guidance accuracy.	Monitor: Apply a governance premium discount until track record as a listed entity is established over 4–6 quarters.	

SECTION 10 — RECOMMENDATION

RATING	TARGET PRICE	CONVICTION	HORIZON	ENTRY ZONE
BUY	■700	HIGH	12–18 months	■400–■460

Entry Zone Rationale

The suggested entry zone of ■400–■460 reflects the current 52-week trading range and allows accumulation near the post-listing consolidation zone. At ■400, the stock would trade at ~25x FY26E earnings — offering a margin of safety. Any near-term market weakness or sector rotation should be used as an opportunity to build positions.

Thesis Invalidation Triggers — Exit / Downgrade Conditions

#	Invalidation Trigger	Action
1	Supa Phase 2 delayed beyond December 2027 or material cost overruns of >20% vs budget — signalling execution capability concerns	REDUCE to HOLD
2	EBITDA margin fails to recover above 6% for 3 consecutive quarters despite Supa ramp — indicating structural margin compression from competitive pricing or copper cost stickiness	REDUCE to HOLD
3	Net Debt-to-Equity exceeds 1.0x post-FY26 without a clear repayment roadmap, or interest coverage falls below 2.5x — signalling balance sheet stress	EXIT

Ideal Investor Profile

KSHINTL is best suited for growth-oriented equity investors with a 12–18 month horizon who are comfortable with the risk profile of a recently listed, founder-managed small-cap in an investment phase. The stock is appropriate for Growth and GARP (Growth at a Reasonable Price) mandates. Value investors should wait for FCF to turn positive (expected FY27E) before establishing positions. Tactical traders may find near-term volatility around quarterly results useful for accumulation, especially if the market focuses on near-term PAT compression (from higher depreciation and interest on Supa debt) rather than the medium-term earnings trajectory.
